

Save Time. Save Money. Save the Environment.

Don't Over-Fertilize

Kentucky soils are so naturally rich in phosphorus, adding more to lawns increases the risk of polluting our waterways.

Do your part.

- Determine nutrient needs with a soil test.
- Carefully apply and use only what you need.
- Fertilize your bluegrass/tall fescue only in the fall to improve drought tolerance and reduce weed growth and mowing frequency.

Your county Extension office can provide more information on soil testing and other simple steps toward sustainable lawn care.
